

Dry firewood

in a ventilated woodshed

Qualities of a good woodshed:

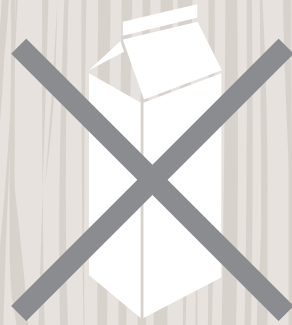

Keep firewood dry

You get more heat out of dry than from the damp firewood because if you burn damp wood, energy is lost in evaporating water.

§ Don't store firewood against the house wall. It is a fire risk.

Burn only dry and clean wood, no rubbish

Burning wood properly

- + More heat
- + Less health damaging emissions
- + No smoke into the neighbourhood
- + Chimney stays clean
- + No harm to the fireplace

Burning rubbish

- Harms the fireplace and duct. Plastic condensates in the chimney and can cause a chimney fire.
- Creates a lot of ash
- Creates smell in the surrounding area and is a health hazard.
- No waste burning in a fireplace. Take milk cartons and other packages to their collections.
